

MINI PROJECT

Library Management System with Issue Tracking

Using MERN Stack

Popular among our collections

Our library's line of collection that have been favoured by our users were shown here. Look for them. Borrow them. Hope you also like them

Abstract

- The Library Management System is a web-based application developed using the MERN stack (MongoDB, Express.js, React.js, Node.js).
- The system provides role-based access for Admin and Students.
- It enables efficient book management, issue tracking, fine calculation, and complaint handling.
- Admin can search students by roll number and view all books issued to them, calculate fines, and manage returns.
- The system reduces manual errors and improves library operations through automation.

Admin View – Student Book Details

Admin

- Search Student
- View Records

Student Details

Name: **Arjun Kumar**

Department: CSE

Roll No: **22CSE123**

Total Books Issued: **3**

Total Fine: **₹25**

Books Issued:

Book Title	Issue Date	Return Date	Status	Fine
Operating Systems	02-Apr-2024	16-Apr-2024	Overdue	₹15
Python Programming	05-Apr-2024	20-Apr-2024	Returned	₹0
Computer Networks	10-Apr-2024	25-Apr-2024	Issued	₹10

Return Book

Add Book

Overdue Alerts

Calculate Fine

Manage Records

- Unlike basic library systems that only manage books, our system focuses on student-level issue tracking.
- The admin can search by roll number and view complete borrowing history, overdue status, and total fine summary.
- The system automatically calculates fine and generates overdue alerts, making it more efficient and transparent.
